Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No.	Applicant(s)	
	10/611,460	FUH ET AL.	
	Examiner	Art Unit	
	Brian P. Whipple	2152	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) Responsive to communication(s) filed on 12 July 2007.
- 2a) This action is FINAL. 2b) This action is non-final.
- 3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) Claim(s) 1-30 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) Claim(s) _____ is/are allowed.
- 6) Claim(s) 1-30 is/are rejected.
- 7) Claim(s) _____ is/are objected to.
- 8) Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) The specification is objected to by the Examiner.
- 10) The drawing(s) filed on _____ is/are: a) accepted or b) objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
 - a) All b) Some * c) None of:
 1. Certified copies of the priority documents have been received.
 2. Certified copies of the priority documents have been received in Application No. _____.
 3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1. Claims 1-30 are pending in this application and presented for examination.

Response to Arguments

2. Applicant's arguments, see pg. 1-2, 35 U.S.C. 112 rejections, filed 7/12/07, with respect to claims 1-21 have been fully considered and are persuasive. The 35 U.S.C. 112 rejections of claims 1-21 have been withdrawn.
3. Applicant's arguments with respect to the 35 U.S.C. 102(e) and 103(a) rejections of the claims have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 112

4. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.
5. Claims 1-21 are rejected under 35 U.S.C. 112.
6. As to claims 1 and 15, the structure of the means (for creating and storing..., receiving..., determining..., and reconfiguring...) are unclear. There is a plurality of devices within the system of claims 1 and 15 and the limitations fail to recite the

Art Unit: 2152

structure of each means in terms of where each is located within the system comprising several devices.

Claim Rejections - 35 USC § 103

7. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

8. Claims 1-9, 13-19, 22-23, and 25-27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Baize, U.S. Patent No. 6,317,838 B1, in view of Sitaraman et al. (Sitaraman), U.S. Patent No. 6,668,283 B1.

9. As to claim 1, Baize discloses a system for controlling access of a client to a network resource (Abstract, ln. 1-3); the system comprising:

a network resource that is communicatively coupled to a network (Fig. 1; Col. 5, ln. 13-22);

a network firewall routing device that is communicatively coupled to the network and that is logically interposed between the client and the network resource (Fig. 1; Abstract, ln. 1-3; Col. 6, ln. 3-9);

an authentication server that is communicatively coupled to the network and to the network firewall routing device and comprising user profile information (Fig. 1, **Security Server SS**; Abstract, ln. 5-11);

means for creating and storing client authorization information at the network firewall routing device, based in part on the user profile information, wherein the client authorization information comprises information indicating whether the client is authorized to communicate with the network resource and information indicating what access privileges the client has with respect to the network resource (Col. 6, ln. 58 – Col. 7, ln. 14; Col. 8, ln. 4-6);

means for receiving a request from the client to communicate with the network resource (Col. 4, ln. 38-42);

means for determining whether the client is authorized to communicate with the network resource based on the authorization information (Col. 4, ln. 43-48); and

Baize may be interpreted as disclosing means for reconfiguring the network firewall routing device to permit the client to communicate with the network resource only when the client is authorized to communicate with the network resource based on the authorization information (Col. 6, ln. 33-42; Col. 7, ln. 15-18). The network firewall routing device must be configured to permit clients to access network resources when authorized in order to function according to its intended purpose.

For the sake of argument, the examiner will assume Baize is silent on means for reconfiguring the network device to permit the client to communicate with the network

Art Unit: 2152

resource only when the client is authorized to communicate with the network resource based on the authorization information.

However, Sitaraman discloses means for reconfiguring the network device to permit the client to communicate with the network resource only when the client is authorized to communicate with the network resource based on the authorization information (Abstract, ln. 17-21).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the teachings of Baize by reconfiguring a network device to permit a client to access network resources when authorized as taught by Sitaraman in order to avoid the need to examine each successive connection authentication to a remote service (Sitaraman: Abstract, ln. 17-21).

10. As to claim 2, Baize and Sitaraman disclose the invention substantially as in parent claim 1, including means for creating and storing client authorization information comprises means in the network firewall routing device for caching client authorization information for each client that communicates with the network firewall routing device (Sitaraman: Abstract, ln. 17-21; Fig. 3).

11. As to claims 3-4, the claims are rejected for the same reasons as claim 2 above.

12. As to claim 5, Baize and Sitaraman disclose the invention substantially as in parent claim 1, including means for determining whether the client is authorized to

communicate with the network resource comprises means for matching information in the request identifying the client to information in means for filtering in the network routing device and to the authorization information stored in the network firewall routing device (Baize: Col. 4, In. 38-48).

13. As to claim 6, Baize and Sitaraman disclose the invention substantially as in parent claim 1, including means for determining whether the client is authorized to communicate with the network resource comprises: means for matching a source IP address of the client in a data packet of the request to information in a filtering mechanism of the network routing device (Baize: Col. 2, In. 55-59; Col. 6, In. 14-21, 33-42, and 62-65); and

means for matching the source IP address to the authorization information stored in the network firewall routing device if the source IP address matches the information in the filtering mechanism of the network routing device (Baize: Col. 6, In. 66 – Col. 7, In. 14).

14. As to claim 7, Baize and Sitaraman disclose the invention substantially as in parent claim 1, including means for determining whether the client is authorized to communicate with the network resource comprises: means for matching a source IP address of the client in a data packet of the request to information in a means for filtering in the network routing device (Baize: Col. 2, In. 55-59; Col. 6, In. 14-21, 33-42, and 62-65);

means for matching the source IP address to the authorization information stored in the network firewall routing device if the source IP address matches the information in the filtering mechanism of the network routing device (Baize: Col. 6, ln. 66 – Col. 7, ln. 14); and

means for matching user identifying information received from the client to a profile associated with the user that is stored in the authentication server if the source IP address fails to match the authorization information stored in the network firewall routing device (Baize: Col. 6, ln. 62 – Col. 7, ln. 18).

15. As to claim 8, Baize and Sitaraman disclose the invention substantially as in parent claim 1, including means for determining whether the client is authorized to communicate with the network resource comprises: means for matching a source IP address of the client in a data packet of the request to information in a filtering mechanism of the network routing device (Baize: Col. 2, ln. 55-59; Col. 6, ln. 14-21, 33-42, and 62-65);

means for matching the source IP address to the authorization information stored in the network firewall routing device if the source IP address matches the information in the filtering mechanism of the network routing device (Baize: Col. 6, ln. 66 – Col. 7, ln. 14); and

means for matching user identifying information received from the client to a profile associated with the user that is stored in a database server and is retrieved from the database server by the authentication server, if the source IP address fails to match

Art Unit: 2152

the authorization information stored in the network firewall routing device (Baize: Fig. 1,

Data Base DBS and Security Server SS; Col. 5, In. 28-31; Col. 6, In. 62 – Col. 7, In.

18).

16. As to claims 13 and 19, the claims are rejected for the same reasons as claims 4 and 8 above.

17. As to claim 9, Baize and Sitaraman disclose the invention substantially as in parent claim 1, including means for determining whether the client is authorized to communicate with the network resource comprises: means for matching client identifying information in the request to information in a filtering mechanism of the network routing device (Baize: Col. 2, In. 55-59; Col. 6, In. 14-21, 33-42, and 62-65);

means for matching the client identifying information to the authorization information stored in the network firewall routing device, if a match is found using the filtering mechanism (Baize: Col. 6, In. 66 – Col. 7, In. 14); and

means used, only when the client identifying information fails to match the authorization information stored in the network firewall routing device, for: creating and storing new authorization information in the network firewall routing device that is uniquely associated with the client (Baize: Col. 6, In. 58 – Col. 7, In. 14; Col. 8, In. 4-6);

requesting login information from the client (Baize: Col. 6, In. 62-65);

authenticating the login information by communicating with the authentication server (Baize: Col. 6, In. 62 – Col. 7, In. 2); and

updating the new authorization information based on information received from the authentication server (Baize: Col. 6, In. 66 – Col. 7, In. 14).

18. As to claim 14, Baize and Sitaraman disclose the invention substantially as in parent claim 1, including means for reconfiguring the network firewall routing device comprises means for creating and storing one or more commands to the network firewall routing device which, when executed by the network firewall routing device, result in modifying one or more routing interfaces of the network firewall routing device to permit communication between the client and the network resource (Baize: Col. 6, In. 62 – Col. 7, In. 18).
19. As to claim 15, the claim is rejected for the same reasons as claim 1 above.
20. As to claim 16, the claim is rejected for the same reasons as claim 4 above.
21. As to claim 17, the claim is rejected for the same reasons as claim 6 above.
22. As to claim 18, the claim is rejected for the same reasons as claim 8 above.
23. As to claim 22, Baize discloses a system for authentication comprising: a network resource connected to a network (Fig. 1; Col. 5, In. 13-22);

Art Unit: 2152

a client capable of sending a request to communicate with the network resource (Col. 4, In. 38-42);

a network firewall routing device that is logically interposed between the client and the network resource and that permits the client to communicate with the network resource only when the client is authorized to communicate with the network resource based on client authorization information stored in the network firewall routing device, wherein the client authorization information comprises information indicating whether the client is authorized to communicate with the network resource and information indicating what access privileges the client has with respect to the network resource (Col. 6, In. 58 – Col. 7, In. 14; Col. 8, In. 4-6);

a database server that stores a plurality of user profiles, each user profile uniquely associated with one of a plurality of users that can use the client to send requests to communicate with the network resource (Col. 5, In. 28-31);

an authentication server that is logically interposed between the network firewall routing device and the database server, and that is capable of communicating with the database server and retrieving from the database server a user profile (Fig. 1, **Data Base DBS and Security Server SS**; Col. 5, In. 28-31; Col. 6, In. 62 – Col. 7, In. 18).

The amended limitation of “reconfigured to permit” is rejected for the same reasons as claim 1 above.

24. As to claim 23, Baize and Sitaraman disclose the invention substantially as in parent claim 22, including the network resource comprises a target server capable of

servicing a request sent under at least one of HyperText Transfer Protocol; File Transfer Protocol (Baize: Col. 6, In. 33-36); and Internet Control Message Protocol.

25. As to claim 25, Baize and Sitaraman disclose the invention substantially as in parent claim 22, including the network firewall routing device comprises: one or more processors (Baize: Fig. 2; Col. 6, In. 13-26; it is inherent that a firewall executing access decisions contains one or more processors); and

a storage medium carrying one or more sequences of one or more instructions including instructions which, when executed by the one or more processors (Baize: Fig. 2; Col. 6, In. 13-26; Col. 7, In. 3-14; it is inherent that a firewall storing an operational profile has a storage medium), cause the one or more processors to perform the steps of:

creating and storing the client authorization information at the network firewall routing device (Baize: Col. 6, In. 66 – Col. 7, In. 18);

receiving the request from the client to communicate with the network resource (Baize: Col. 6, In. 58-61);

determining whether the client is authorized to communicate with the network resource based on the client authorization information (Baize: Col. 6, In. 62 – Col. 7, In. 18); and

permitting the client to communicate with the network resource only when the client is authorized to communicate with the network resource based on the client authorization information (Baize: Col. 6, In. 62 – Col. 7, In. 18).

Art Unit: 2152

26. As to claim 26, the claim is rejected for the same reasons as claim 14 above.

27. As to claim 27, Baize and Sitaraman disclose the invention substantially as in parent claim 25, including determining whether the client is authorized to communicate with the network resource comprises the steps of: determining whether client identifying information in the request matches information in a filtering mechanism of the network firewall routing device (Baize: Col. 6, In. 58-65);

if a match is found using the filtering mechanism, determining whether the client identifying information matches the client authorization information stored in the network firewall routing device (Baize: Col. 6, In. 66 – Col. 7, In. 18); and

only when the client identifying information fails to match the client authorization information stored in the network firewall routing device (Baize: Col. 6, In. 66 – Col. 7, In. 18), then:

creating and storing new client authorization information in the network firewall routing device that is uniquely associated with the client (Baize: Col. 6, In. 66 – Col. 7, In. 18);

requesting login information from the client (Baize: Col. 6, In. 62-65);
authenticating the login information by communicating with the authentication server (Baize: Col. 6, In. 66 – Col. 7, In. 18); and

updating the new client authorization information based on information received from the authentication server (Baize: Col. 6, In. 66 – Col. 7, In. 18).

Art Unit: 2152

28. Claim 12 is rejected under 35 U.S.C. 103(a) as being unpatentable over Baize and Sitaraman as applied to claim 1 above, in view of Coss et al. (Coss), U.S. Patent No. 6,170,012 B1.

29. As to claim 12, Baize and Sitaraman disclose the invention substantially as in parent claim 9, but are silent on means for creating and storing an inactivity timer for each authentication cache, wherein the inactivity timer expires when no communications are directed from the client to the network resource through the network firewall routing device during a pre-determined period of time, and means for removing the updated authentication information when the inactivity timer expires.

However, Coss discloses means for creating and storing an inactivity timer for each authentication cache, wherein the inactivity timer expires when no communications are directed from the client to the network resource through the network firewall routing device during a pre-determined period of time, and means for removing the updated authentication information when the inactivity timer expires (Col. 4, ln. 45-46).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the teachings of Baize and Sitaraman by utilizing an inactivity timer to remove cache entries as taught by Coss in order to free up space in a cache and in order to improve security by requiring an inactive client to re-authenticate.

Art Unit: 2152

30. Claims 10-11, 20-21, 24, and 28-30 are rejected under 35 U.S.C. 103(a) as being unpatentable over Baize and Sitaraman as applied to claims 9, 15, 22, and 27 above, in view of Klassen, U.S. Patent No. 6,216,121 B1.

31. As to claim 10, Baize and Sitaraman disclose the invention substantially as in parent claim 9, including means for the network firewall routing device requesting login information from the client to solicit a username and a user password (Baize: Col. 6, In. 62-65) and means for authenticating the login information comprises means for determining, from a profile associated with a user of the client stored in the authentication server, whether the username and password are valid (Baize: Col. 6, In. 66 – Col. 7, In. 2), but are silent on sending a Hypertext Markup language login form to the client.

However, Klassen discloses sending a Hypertext Markup language login form to the client (Fig. 5; Col. 5, In. 3-5).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the teachings of Baize and Sitaraman by using a Hypertext Markup language login form as taught by Klassen in order to make use of a standard means for a client to login to a system and in order to authenticate the identify of the client.

32. As to claim 11, the claim is rejected for the same reasons as claims 8 and 10 above.

Art Unit: 2152

33. As to claim 21, Baize and Sitaraman disclose the invention substantially as in parent claim 15, but are silent on the client in a computer system executing a Web browser.

However, Klassen discloses the client in a computer system executing a Web browser (Fig. 5; Col. 5, ln. 3-5).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the teachings of Baize and Sitaraman by using a Web browser as taught by Klassen in order to make use of a standard means for a client to communicate with the Internet.

34. As to claim 24, the claim is rejected for the same reasons as claim 21 above.

35. As to claims 20 and 28-29, the claims are rejected for the same reasons as claim 11 above.

36. As to claim 30, the claim is rejected for the same reasons as claim 10 above.

37. Claims 1-9, 13-19, 22-23, and 25-27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Baize, U.S. Patent No. 6,317,838 B1, in view of Sadovsky, U.S. Patent No. 5,689,638.

38. As to claim 1, Baize discloses a system for controlling access of a client to a network resource (Abstract, ln. 1-3), the system comprising:

a network resource that is communicatively coupled to a network (Fig. 1; Col. 5, ln. 13-22);

a network firewall routing device that is communicatively coupled to the network and that is logically interposed between the client and the network resource (Fig. 1; Abstract, ln. 1-3; Col. 6, ln. 3-9);

an authentication server that is communicatively coupled to the network and to the network firewall routing device and comprising user profile information (Fig. 1,

Security Server SS; Abstract, ln. 5-11);

means for creating and storing client authorization information at the network firewall routing device, based in part on the user profile information, wherein the client authorization information comprises information indicating whether the client is authorized to communicate with the network resource and information indicating what access privileges the client has with respect to the network resource (Col. 6, ln. 58 – Col. 7, ln. 14; Col. 8, ln. 4-6);

means for receiving a request from the client to communicate with the network resource (Col. 4, ln. 38-42);

means for determining whether the client is authorized to communicate with the network resource based on the authorization information (Col. 4, ln. 43-48); and

Baize may be interpreted as disclosing means for reconfiguring the network firewall routing device to permit the client to communicate with the network resource

only when the client is authorized to communicate with the network resource based on the authorization information (Col. 6, ln. 33-42; Col. 7, ln. 15-18). The network firewall routing device must be configured to permit clients to access network resources when authorized in order to function according to its intended purpose.

For the sake of argument, the examiner will assume Baize is silent on means for reconfiguring the network device to permit the client to communicate with the network resource only when the client is authorized to communicate with the network resource based on the authorization information.

However, Sadovsky discloses means for reconfiguring the network device to permit the client to communicate with the network resource only when the client is authorized to communicate with the network resource based on the authorization information (Col. 9, ln. 66 – Col. 10, ln. 6).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the teachings of Baize by reconfiguring a network device to permit a client to access network resources when authorized as taught by Sadovsky in order to avoid the need to request authentication data from a user (Sadovsky: Col. 9, ln. 66 – Col. 10, ln. 6).

39. As to claim 2, Baize and Sadovsky disclose the invention substantially as in parent claim 1, including means for creating and storing client authorization information comprises means in the network firewall routing device for caching client authorization

information for each client that communicates with the network firewall routing device (Sadovsky: Col. 9, In. 66 – Col. 10, In. 6).

40. As to claims 3-4, the claims are rejected for the same reasons as claim 2 above.

41. As to claim 5, Baize and Sadovsky disclose the invention substantially as in parent claim 1, including means for determining whether the client is authorized to communicate with the network resource comprises means for matching information in the request identifying the client to information in means for filtering in the network routing device and to the authorization information stored in the network firewall routing device (Baize: Col. 4, In. 38-48).

42. As to claim 6, Baize and Sadovsky disclose the invention substantially as in parent claim 1, including means for determining whether the client is authorized to communicate with the network resource comprises: means for matching a source IP address of the client in a data packet of the request to information in a filtering mechanism of the network routing device (Baize: Col. 2, In. 55-59; Col. 6, In. 14-21, 33-42, and 62-65); and

means for matching the source IP address to the authorization information stored in the network firewall routing device if the source IP address matches the information in the filtering mechanism of the network routing device (Baize: Col. 6, In. 66 – Col. 7, In. 14).

43. As to claim 7, Baize and Sadovsky disclose the invention substantially as in parent claim 1, including means for determining whether the client is authorized to communicate with the network resource comprises: means for matching a source IP address of the client in a data packet of the request to information in a means for filtering in the network routing device (Baize: Col. 2, In. 55-59; Col. 6, In. 14-21, 33-42, and 62-65);

means for matching the source IP address to the authorization information stored in the network firewall routing device if the source IP address matches the information in the filtering mechanism of the network routing device (Baize: Col. 6, In. 66 – Col. 7, In. 14); and

means for matching user identifying information received from the client to a profile associated with the user that is stored in the authentication server if the source IP address fails to match the authorization information stored in the network firewall routing device (Baize: Col. 6, In. 62 – Col. 7, In. 18).

44. As to claim 8, Baize and Sadovsky disclose the invention substantially as in parent claim 1, including means for determining whether the client is authorized to communicate with the network resource comprises: means for matching a source IP address of the client in a data packet of the request to information in a filtering mechanism of the network routing device (Baize: Col. 2, In. 55-59; Col. 6, In. 14-21, 33-42, and 62-65);

Art Unit: 2152

means for matching the source IP address to the authorization information stored in the network firewall routing device if the source IP address matches the information in the filtering mechanism of the network routing device (Baize: Col. 6, ln. 66 – Col. 7, ln. 14); and

means for matching user identifying information received from the client to a profile associated with the user that is stored in a database server and is retrieved from the database server by the authentication server, if the source IP address fails to match the authorization information stored in the network firewall routing device (Baize: Fig. 1, **Data Base DBS and Security Server SS**; Col. 5, ln. 28-31; Col. 6, ln. 62 – Col. 7, ln. 18).

45. As to claims 13 and 19, the claims are rejected for the same reasons as claims 4 and 8 above.

46. As to claim 9, Baize and Sadovsky disclose the invention substantially as in parent claim 1, including means for determining whether the client is authorized to communicate with the network resource comprises: means for matching client identifying information in the request to information in a filtering mechanism of the network routing device (Baize: Col. 2, ln. 55-59; Col. 6, ln. 14-21, 33-42, and 62-65);

means for matching the client identifying information to the authorization information stored in the network firewall routing device, if a match is found using the filtering mechanism (Baize: Col. 6, ln. 66 – Col. 7, ln. 14); and

means used, only when the client identifying information fails to match the authorization information stored in the network firewall routing device, for: creating and storing new authorization information in the network firewall routing device that is uniquely associated with the client (Baize: Col. 6, In. 58 – Col. 7, In. 14; Col. 8, In. 4-6);

requesting login information from the client (Baize: Col. 6, In. 62-65);

authenticating the login information by communicating with the authentication server (Baize: Col. 6, In. 62 – Col. 7, In. 2); and

updating the new authorization information based on information received from the authentication server (Baize: Col. 6, In. 66 – Col. 7, In. 14).

47. As to claim 14, Baize and Sadovsky disclose the invention substantially as in parent claim 1, including means for reconfiguring the network firewall routing device comprises means for creating and storing one or more commands to the network firewall routing device which, when executed by the network firewall routing device, result in modifying one or more routing interfaces of the network firewall routing device to permit communication between the client and the network resource (Baize: Col. 6, In. 62 – Col. 7, In. 18).

48. As to claim 15, the claim is rejected for the same reasons as claim 1 above.

49. As to claim 16, the claim is rejected for the same reasons as claim 4 above.

Art Unit: 2152

50. As to claim 17, the claim is rejected for the same reasons as claim 6 above.

51. As to claim 18, the claim is rejected for the same reasons as claim 8 above.

52. As to claim 22, Baize discloses a system for authentication comprising: a network resource connected to a network (Fig. 1; Col. 5, ln. 13-22);

a client capable of sending a request to communicate with the network resource (Col. 4, ln. 38-42);

a network firewall routing device that is logically interposed between the client and the network resource and that permits the client to communicate with the network resource only when the client is authorized to communicate with the network resource based on client authorization information stored in the network firewall routing device, wherein the client authorization information comprises information indicating whether the client is authorized to communicate with the network resource and information indicating what access privileges the client has with respect to the network resource (Col. 6, ln. 58 – Col. 7, ln. 14; Col. 8, ln. 4-6);

a database server that stores a plurality of user profiles, each user profile uniquely associated with one of a plurality of users that can use the client to send requests to communicate with the network resource (Col. 5, ln. 28-31);

an authentication server that is logically interposed between the network firewall routing device and the database server, and that is capable of communicating with the

Art Unit: 2152

database server and retrieving from the database server a user profile (Fig. 1, **Data Base DBS and Security Server SS**; Col. 5, ln. 28-31; Col. 6, ln. 62 – Col. 7, ln. 18).

The amended limitation of “reconfigured to permit” is rejected for the same reasons as claim 1 above.

53. As to claim 23, Baize and Sadovsky disclose the invention substantially as in parent claim 22, including the network resource comprises a target server capable of servicing a request sent under at least one of HyperText Transfer Protocol; File Transfer Protocol (Baize: Col. 6, ln. 33-36); and Internet Control Message Protocol.

54. As to claim 25, Baize and Sadovsky disclose the invention substantially as in parent claim 22, including the network firewall routing device comprises: one or more processors (Baize: Fig. 2; Col. 6, ln. 13-26; it is inherent that a firewall executing access decisions contains one or more processors); and

a storage medium carrying one or more sequences of one or more instructions including instructions which, when executed by the one or more processors (Baize: Fig. 2; Col. 6, ln. 13-26; Col. 7, ln. 3-14; it is inherent that a firewall storing an operational profile has a storage medium), cause the one or more processors to perform the steps of:

creating and storing the client authorization information at the network firewall routing device (Baize: Col. 6, ln. 66 – Col. 7, ln. 18);

Art Unit: 2152

receiving the request from the client to communicate with the network resource (Baize: Col. 6, In. 58-61);
determining whether the client is authorized to communicate with the network resource based on the client authorization information (Baize: Col. 6, In. 62 – Col. 7, In. 18); and

permitting the client to communicate with the network resource only when the client is authorized to communicate with the network resource based on the client authorization information (Baize: Col. 6, In. 62 – Col. 7, In. 18).

55. As to claim 26, the claim is rejected for the same reasons as claim 14 above.

56. As to claim 27, Baize and Sadovsky disclose the invention substantially as in parent claim 25, including determining whether the client is authorized to communicate with the network resource comprises the steps of: determining whether client identifying information in the request matches information in a filtering mechanism of the network firewall routing device (Baize: Col. 6, In. 58-65);

if a match is found using the filtering mechanism, determining whether the client identifying information matches the client authorization information stored in the network firewall routing device (Baize: Col. 6, In. 66 – Col. 7, In. 18); and

only when the client identifying information fails to match the client authorization information stored in the network firewall routing device (Baize: Col. 6, In. 66 – Col. 7, In. 18), then:

Art Unit: 2152

creating and storing new client authorization information in the network firewall routing device that is uniquely associated with the client (Baize: Col. 6, In. 66 – Col. 7, In. 18);

requesting login information from the client (Baize: Col. 6, In. 62-65);

authenticating the login information by communicating with the authentication server (Baize: Col. 6, In. 66 – Col. 7, In. 18); and

updating the new client authorization information based on information received from the authentication server (Baize: Col. 6, In. 66 – Col. 7, In. 18).

57. Claim 12 is rejected under 35 U.S.C. 103(a) as being unpatentable over Baize and Sadovsky as applied to claim 1 above, in view of Coss et al. (Coss), U.S. Patent No. 6,170,012 B1.

58. As to claim 12, Baize and Sadovsky disclose the invention substantially as in parent claim 9, but are silent on means for creating and storing an inactivity timer for each authentication cache, wherein the inactivity timer expires when no communications are directed from the client to the network resource through the network firewall routing device during a pre-determined period of time, and means for removing the updated authentication information when the inactivity timer expires.

However, Coss discloses means for creating and storing an inactivity timer for each authentication cache, wherein the inactivity timer expires when no communications are directed from the client to the network resource through the

network firewall routing device during a pre-determined period of time, and means for removing the updated authentication information when the inactivity timer expires (Col. 4, ln. 45-46).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the teachings of Baize and Sadovsky by utilizing an inactivity timer to remove cache entries as taught by Coss in order to free up space in a cache and in order to improve security by requiring an inactive client to re-authenticate.

59. Claims 10-11, 20-21, 24, and 28-30 are rejected under 35 U.S.C. 103(a) as being unpatentable over Baize and Sadovsky as applied to claims 9, 15, 22, and 27 above, in view of Klassen, U.S. Patent No. 6,216,121 B1.

60. As to claim 10, Baize and Sadovsky disclose the invention substantially as in parent claim 9, including means for the network firewall routing device requesting login information from the client to solicit a username and a user password (Baize: Col. 6, ln. 62-65) and means for authenticating the login information comprises means for determining, from a profile associated with a user of the client stored in the authentication server, whether the username and password are valid (Baize: Col. 6, ln. 66 – Col. 7, ln. 2), but are silent on sending a Hypertext Markup language login form to the client.

However, Klassen discloses sending a Hypertext Markup language login form to the client (Fig. 5; Col. 5, ln. 3-5).

Art Unit: 2152

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the teachings of Baize and Sadovsky by using a Hypertext Markup language login form as taught by Klassen in order to make use of a standard means for a client to login to a system and in order to authenticate the identify of the client.

61. As to claim 11, the claim is rejected for the same reasons as claims 8 and 10 above.

62. As to claim 21, Baize and Sadovsky disclose the invention substantially as in parent claim 15, but are silent on the client in a computer system executing a Web browser.

However, Klassen discloses the client in a computer system executing a Web browser (Fig. 5; Col. 5, ln. 3-5).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the teachings of Baize and Sadovsky by using a Web browser as taught by Klassen in order to make use of a standard means for a client to communicate with the Internet.

63. As to claim 24, the claim is rejected for the same reasons as claim 21 above.

64. As to claims 20 and 28-29, the claims are rejected for the same reasons as claim 11 above.

65. As to claim 30, the claim is rejected for the same reasons as claim 10 above.

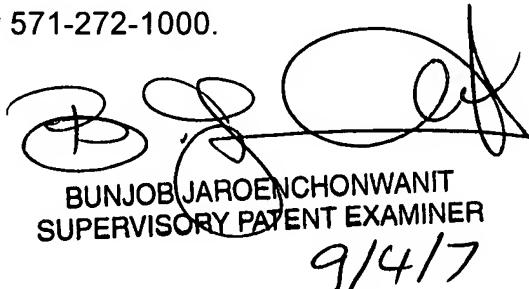

Conclusion

66. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Brian P. Whipple whose telephone number is (571) 270-1244. The examiner can normally be reached on Mon-Fri (8:30 AM to 5:00 PM EST).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Bunjob Jaroenchonwanit can be reached on (571) 272-3913. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
